

ACKNOWLEDGEMENT

- I express my sincere gratitude to **Sundram Finance Group** for providing me the opportunity to undergo this internship and for their valuable guidance throughout the project duration.
- I would like to extend my heartfelt thanks to my internship coordinator and the entire team at the organization for their continuous support, encouragement, and technical insights that greatly helped in shaping this project.
- I am also grateful to the **Department of Computer Science and Engineering, Panimalar Engineering College**, for giving me the platform to apply my knowledge in a real-world scenario and for their constant support.
- I would especially like to thank my faculty mentor and project guide for their expert advice, encouragement, and timely feedback which were crucial in the successful completion of the project.
- Finally, I thank my parents, friends, and well-wishers for their moral support and motivation during every phase of this internship.

DECLARATION

I, **Pathra Shakthi**, Reg. No. **211423104435** a student of **Computer Science and Engineering**, Panimalar Engineering College, hereby declare that the internship project report entitled:

“Travel Guidance Web Application”

submitted to **Panimalar Engineering College**, is a record of original work done by me during the internship period from **26-May-2025 to 26-June-2025** at **Sundram Finance Group**, Chennai.

This report has been prepared purely for academic requirements and has not been submitted to any other institution or university for the award of any degree, diploma, or certificate.

Place: Chennai

Date: 26-June-2025

Submitted by

ABSTRACT

- The project titled **Travel Guidance Web Application** is designed to help users who are visiting unfamiliar locations for **exams, internships, or business visits**.
- It begins with a **user registration form** that collects basic details such as:
 - Name
 - Mobile Number
 - Email ID
- Users can then plan their trip by selecting:
 - **Country, State, and District**
 - **Number of days** for the visit
 - **Center location** (exam venue, internship site, or meeting place)
- Based on the selected center location, the system:
 - Suggests **nearby hotels** for stay
 - Recommends **tourist spots** close to the center
- It also provides **route suggestions**:
 - **Train routes** if the user chooses train travel
 - **Bus route numbers** if the user prefers bus travel
- Technologies used in the project include:
 - **HTML and CSS** for frontend development
 - **Python with Flask** for backend logic
 - **MySQL** for data storage and management
- The system integrates all these technologies to provide a **practical, efficient, and user-friendly travel planning solution**.

INTRODUCTION

This internship project, carried out by **PATHRA SHATKHI**, a student of **Panimalar Engineering College**, under the guidance of **Sundram Finance Group**, involves the design and development of a web-based application titled **Travel Guidance Web Application**. The primary goal of this project is to assist individuals who are visiting new locations for short-term purposes such as exams, internships, or business meetings.

The application begins by collecting basic details from the user through a registration form, including their **name, mobile number, and email ID**. Upon registration, the user is directed to a travel planning interface where they sequentially select:

- **Country**
- **State** (based on selected country)
- **District** (based on selected state)
- **Number of days** for the visit
- **Center location** (exam center, office, or training venue)

After selecting the center, the system dynamically suggests:

- **Nearby hotels** for convenient accommodation
- **Nearby tourist spots** the user can explore during their stay

The system also assists with **route planning** by providing:

- **Train route information** for users opting to travel by train
- **Bus route numbers** for those traveling by bus

All the data entered by the user is:

- **Stored in a MySQL database**
- **Fetches using Python** for backend processing
- **Presented through a user-friendly interface** designed with HTML and CSS

This project demonstrates the effective integration of **frontend and backend technologies**, showcasing real-time functionality, database operations, and user interaction within a single application. It aims to simplify the travel experience by offering personalized, location-based guidance and route planning.

COMPANY PROFILE

- **Name:** Sundram Finance Group
- **Founded:** 1954
- **Headquarters:** Chennai, Tamil Nadu, India
- **Type:** Non-Banking Financial Company (NBFC)
- **Parent Organization:** TVS Group
- **Website:** www.sundaramfinance.in

ABOUT THE COMPANY

- **Sundram Finance Limited (SFL)** is one of India's most trusted and well-established non-banking financial institutions.
- It was founded with the goal of supporting individuals and businesses by providing **vehicle financing**, especially for commercial vehicles.
- Over the years, the company has diversified into areas such as:
 - **Insurance**
 - **Mutual Funds**
 - **Home Finance**
 - **Asset Management**
 - **Leasing and Logistics**
- Sundram Finance is part of the renowned **TVS Group**, which is a leading conglomerate in India, especially known in the automotive sector.

VISION AND VALUES

- **Vision:** To be the most respected NBFC delivering long-term value to customers, employees, and shareholders.
- **Core Values:**
 - Integrity
 - Honesty
 - Prudence
 - Discipline
 - Fair Play

- Customer-Centric Services
- Humaility
- Openness

STRENGTHS OF THE COMPANY

- Over **60+ years** of experience in financial services
- Strong brand reputation and loyal customer base
- Nationwide presence with over **600+ branches**
- Focus on **technology-driven financial solutions**

OBJECTIVE

- To develop a **web-based travel guidance application** that assists users in planning their travel for exams, internships, or business-related visits.
- To enable users to **register and input travel preferences** such as location, duration of stay, and purpose of visit.
- To provide **personalized suggestions** for:
 - Nearby hotels based on the center location
 - Tourist places near the selected center
 - Bus and train routes for easier travel
- To implement a system that **connects frontend and backend seamlessly** using:
 - **HTML/CSS** for user interface
 - **Python** for server-side logic
 - **MySQL** for database management
- To ensure all user inputs are **securely stored and can be retrieved** as needed for future reference or analysis.
- To showcase the integration of **multiple technologies** in solving a practical travel assistance problem through an efficient and user-friendly platform.

PROBLEM STATEMENT

- Many individuals travel to unfamiliar places for purposes such as **examinations, internships, business meetings, or training programs**.
- These users often face challenges such as:
 - **Lack of knowledge about local accommodations** near the center location
 - **Difficulty in identifying nearby tourist spots** for leisure during their stay
 - **Uncertainty in travel routes**, including bus and train connectivity to the center
- There is **no unified platform** that combines registration, travel planning, hotel recommendation, and route suggestion in a single interface.
- Manual planning through various sources can be **time-consuming, confusing, and inefficient** for users.
- Therefore, there is a need for a **smart travel guidance system** that:
 - Collects user information and preferences
 - Recommends suitable **hotels and tourist spots**
 - Suggests **accurate travel routes** for buses and trains
 - Stores all user data in a structured and accessible format
- This system will simplify travel planning and provide users with a **convenient and reliable travel assistant**, especially useful for short-term visits with limited local knowledge.

LITERATURE REVIEW

A literature review helps understand the existing technologies, systems, and research relevant to travel planning, web development, and user experience design. This project draws from various concepts and tools widely studied and used in the industry.

1. Travel Assistance Systems

- Previous studies and applications in the travel domain mainly focus on **hotel booking, navigation apps, or tourist guides**, each serving a specific purpose.
- However, most of these systems are not fully integrated. Users still need to visit multiple platforms to plan an entire trip—from registration to accommodation and route planning.

2. Web-Based Travel Planning Tools

- Tools like **Google Travel, Booking.com, and Rome2Rio** provide partial travel-related services.
- These systems are often generalized and do not provide specific guidance based on **exam centers, internship venues, or business locations**.
- Our system improves this by offering **personalized planning** based on center location and duration of stay.

3. Location-Based Services (LBS)

- LBS technology is commonly used in applications for **finding nearby places, restaurant suggestions, or local sightseeing**.
- The proposed system uses a similar approach by offering hotel and tourist spot suggestions **based on the center location** selected by the user.

4. Route Planning Applications

- Public transport apps (like state transport portals or Indian Railways websites) offer **bus or train route data**, but these require manual search.
- Our project automates this by providing **bus route numbers or train details** once the user enters travel mode and location, improving efficiency.

5. Use of Full-Stack Web Technologies

- The combination of **HTML, CSS (frontend), Flask (Python backend), and MySQL (database)** is a widely adopted tech stack for building real-time web applications.
- This project utilizes this tech stack effectively, ensuring smooth communication between the front-end user interface and the backend logic/database.
